

Automated Verification of User Interface Tests on Low-End
Emulators and Devices

ABSTRACT OF THE DISCLOSURE

5 Testing of computing devices is automated by recording each
of the tests once, capturing user interface operations as a re-
cord, and then rerunning the tests repetitively and automati-
cally on the same or different instances of the target device,
substantially without human intervention. A successful test is
10 indicated by identity of corresponding screens captured from a
reference device and the target device..
